CHALLENGES  DOCUMENT

THEME 1: ADVERTISING

Challenge: Ad trust and authenticity

Description:

Digital advertising is being flooded with AI-generated fakes: deepfake celebrity endorsements, cloned brand voices, and scam ads that borrow the look of trusted companies to trick consumers. As generative AI makes fake content cheaper and more convincing to produce, brands, ad platforms, and consumers all need new ways to answer one simple question: can this ad be trusted? This challenge asks participants to use AI to protect trust in digital advertising, whether by catching fake or harmful ads before they reach audiences, or by giving legitimate brands a way to prove their ads are authentic.

The Challenges:

Participants must build an AI-driven tool that protects trust in digital advertising. Teams are free to choose one of two angles, or combine both into a single tool:

- Detection & Verification angle: an AI system that analyzes ad content (images, video, audio, text, or landing pages) and flags signs that it is fake, manipulated, deepfaked, or linked to scam/harmful content.

THEME 1: ADVERTISING

Challenge: Ad trust and authenticity

- Watermarking & Provenance angle: a tool that lets brands mark, sign, or certify their AI-generated (or human-made) ads as authentic, so platforms and consumers can verify the true source of an ad.

Teams are encouraged to think about the full ecosystem: the brand placing the ad, the platform distributing it, and the consumer viewing it. A strong submission clearly explains who benefits from the tool and how it fits into a real ad-placement workflow.

Example ideas to get started:

Detection / Verification tools

- A deepfake detector for video/audio ads that flags AI-manipulated faces or cloned voices.
- A multi-agent "ad reviewer" chatbot: one agent checks visual authenticity, one checks the claims against known brand facts, one checks the landing page/URL for scam patterns, and a final agent produces a trust score and explanation.
- A scam-ad classifier that scans ad text, images, and destination links to detect phishing, fake giveaways, or impersonation of real brands.

THEME 1: ADVERTISING

Challenge: Ad trust and authenticity

- A browser extension or dashboard for ad platforms that reviews incoming ad submissions and produces a risk report before they go live.

Watermarking / Provenance tools

- An invisible watermarking tool that embeds a verifiable signature into brand-approved AI-generated ad creative.
- A provenance dashboard where brands register their official ads, generating a certificate or QR code that platforms and consumers can scan to confirm authenticity.
- A "content credentials" style tool that attaches metadata about how an ad was made (AI tool used, brand, date, approval chain) and lets anyone verify it hasn't been altered.

Merged approach

- A single platform where brands can watermark their own authentic ads AND where any ad can be checked for authenticity/manipulation, combining detection and provenance into one trust layer for digital advertising.

THEME 2: MARKETING & BRANDING

Challenge: AI Virtual Focus Group

Description:

Building and evolving a brand is expensive and slow: testing a new concept with real consumers can take weeks and cost a lot of money, and figuring out how to make a brand feel fresh again for a new audience is a constant challenge for companies of every size. AI opens up new possibilities on both fronts, letting teams simulate consumer feedback in minutes instead of weeks, and reimagine a brand's identity across entirely different aesthetics and eras. This theme includes two independent challenges. Participants can choose either one to work on.

The Challenges:

Traditional focus groups are slow and costly: recruiting real people, scheduling sessions, and waiting weeks for feedback before a brand can validate a new concept, logo, or campaign. This challenge asks participants to replace (or complement) that process with an AI-driven simulation.

THEME 2: MARKETING & BRANDING

Challenge: AI Virtual Focus Group

What participants need to build:

An AI-driven simulation tool that creates a virtual focus group made up of diverse consumer personas.

A marketer should be able to pitch a new branding concept, logo, tagline, or campaign to the tool, which then triggers an automated panel of custom-prompted LLM agents, each one playing a distinct consumer persona (for example by age, culture, income level, or values).

These agents should debate with each other to critique the brand concept, surface potential risks, and represent genuinely different points of view rather than all converging on the same opinion. The final output should bring everything together: the different reactions, the risks identified, an overall score or verdict, and clear qualitative detail a marketer could actually act on.

Example ideas to get started:

- A multi-agent chatbot where each agent is prompted with a distinct persona (e.g., "budget-conscious parent," "Gen Z trendsetter," "loyal long-time customer") and reacts independently to an uploaded logo or concept.

THEME 2: MARKETING & BRANDING

Challenge: AI Virtual Focus Group

- A "panel debate" mode where personas respond to each other's opinions in a simulated discussion, then a moderator agent summarizes the areas of agreement and disagreement.
- A scoring dashboard that turns the panel's qualitative reactions into a quantitative brand-risk score, with a breakdown by persona segment.
- A tool that lets a marketer upload multiple concept variants (e.g., three logo options) and get a comparative panel verdict on which performs best with which audience segment.
- A report generator that compiles the full simulated focus-group session into a shareable summary document with recommendations.
